# About Rollon

## Development of global business

- 1975** Parent company, Rollon S.r.l., founded in Italy
- 1991** Founding of Rollon GmbH in Germany
- 1995** Expansion of headquarters to new 4,000 m<sup>2</sup> factory  
Assembly starts in Germany  
Quality management certified to ISO 9001
- 1998** Rollon B.V. in the Netherlands and Rollon Corporation in the USA are founded  
Expansion of German branch to new 1,000 m<sup>2</sup> plant
- 1999** Founding of Rollon S.A.R.L. in France  
Environmental management certified to ISO 14001
- 2000** Rollon s.r.o. founded in Czech Republic
- 2001** Expansion of headquarters to new 12,000 m<sup>2</sup> manufacturing plant
- 2007** Restructuring of the GmbH and alignment of production in Germany to customer-specific adaptations  
Takeover of the assets of a manufacturer of linear rail systems
- 2008** Expansion of sales network in Eastern Europe and Asia

## Continual expansion and optimization of the portfolio

Founded in 1975, Rollon manufactured high-precision linear roller bearings for the machine tool industry. Early on, Rollon started manufacturing linear bearings based on the bearing-cage design. In 1979, the Compact Rail self-aligning linear bearings joined the Telescopic Rail industrial drawer slides and Easy Rail linear bearings and became the basis of the strong foundation on which the company is building upon today. Continuing optimization of these core products still remains one of the most important goals at Rollon. The development of the patented Compact Rail linear bearing, which uses different proprietary rail profiles and high-precision radial ball bearing sliders, enables the compensation of height and angle mounting defects in applications, and is only one example of the continuing efforts to innovative the development of our existing product families. In the same manner, we continually introduce innovative new product families displaying our continuing product development and optimization in the industry. These include:

- 1994 Light Rail - full and partial extension telescopic in lightweight design
- 1996 Uniline - belt driven linear actuators
- 2001 Ecoline - economical aluminum linear actuators
- 2002 X-Rail - inexpensive formed steel linear guides
- 2004 Curviline - curved monorail profile rail guide with roller carriages
- 2007 Monorail - miniature sizes and full sized

Each further innovation of our linear bearings is built upon the our extensive knowledge of the nine product families in production today as well as on the current market demands. Rollon is the ultimate linear technology for any application needs.

# Product explanation

## Telescopic Rail: Seven models with full and partial extension

Fig. 1

The Telescopic Rail product line is made up of seven models with full and partial extension and various cross-sections and intermediate elements in S-shape, double-T or square. High loads in combination with cost-efficiency and free movement have long been the outstanding properties of the Telescopic Rail product line.

### The most important characteristics:

- High loading with low deflexion
- Rigid intermediate elements
- Standardised gauge for holes
- Zero-play running even with maximum load
- Space saving design
- High reliability

### Preferred areas of application of the Telescopic Rail product family:

- Railcars (e. g. maintenance and battery extensions, doors)
- Construction and machine technology (e.g., housings and doors)
- Logistics (e.g., extensions for containers or gripper movements)
- Automotive technology
- Packaging machines
- Beverage industry
- Special machines

**ASN**

Partial extension consisting of a guide rail and a slider. This compact size and simple design allow very high load capacities. The high system rigidity is formed here in connection with the adjacent construction.

Fig. 2

**DS**

Full extension consisting of two guide rails made of fixed and movable element and an S-shaped intermediate element. This has a high moment of inertia and high rigidity with slim size. This results in a high loading capacity with low deflexion in the extended state.

The DS series is available in three different designs: Version S with one-sided extension (DSS), Version B with locking in the extracted state for one-sided extension (DSB) and Version D with double-sided extension (DSD).

Fig. 3

**DE**

Full extension consisting of two guide rails, which together, combined as double-T profile, form the intermediate element, and two sliders, which as fixed and movable element form the connection to the adjacent construction. The square cross-section allows a compact size with high load capacities and low deflexion, especially with radial loading. A custom design is available for extensions with double-sided strokes. The simultaneous movement of the intermediate element is implemented with a driving disc.

Fig. 4

**DBN**

Full extension consisting of two guide rails, which are both fixed and movable element, and two sliders which together form the intermediate element. The size is similar to the DE series and offers good protection from dirt of the open ballcage.

Fig. 5

### LTF

Full extension consisting of two guide rails as fixed and movable element and an S-shaped intermediate element. This special shape allows an extremely slim and compact design for movements that are only occasionally executed.

Fig. 6

### DMS

Heavy load telescopic consisting of elements from the ASN series and an extremely rigid double-T profile as intermediate element. This full extension is used to accept the heaviest loads with low deflexion.

Fig. 7

### DRT

Full extension on a roller slide base consisting of the S-shaped intermediate element from DS series and elements of the proven Compact Rail roller slider system. The use of roller sliders instead of a linear bearing as a load accepting element enables a larger resistance against contamination and an extremely quiet running of the full extension.

# Technical data

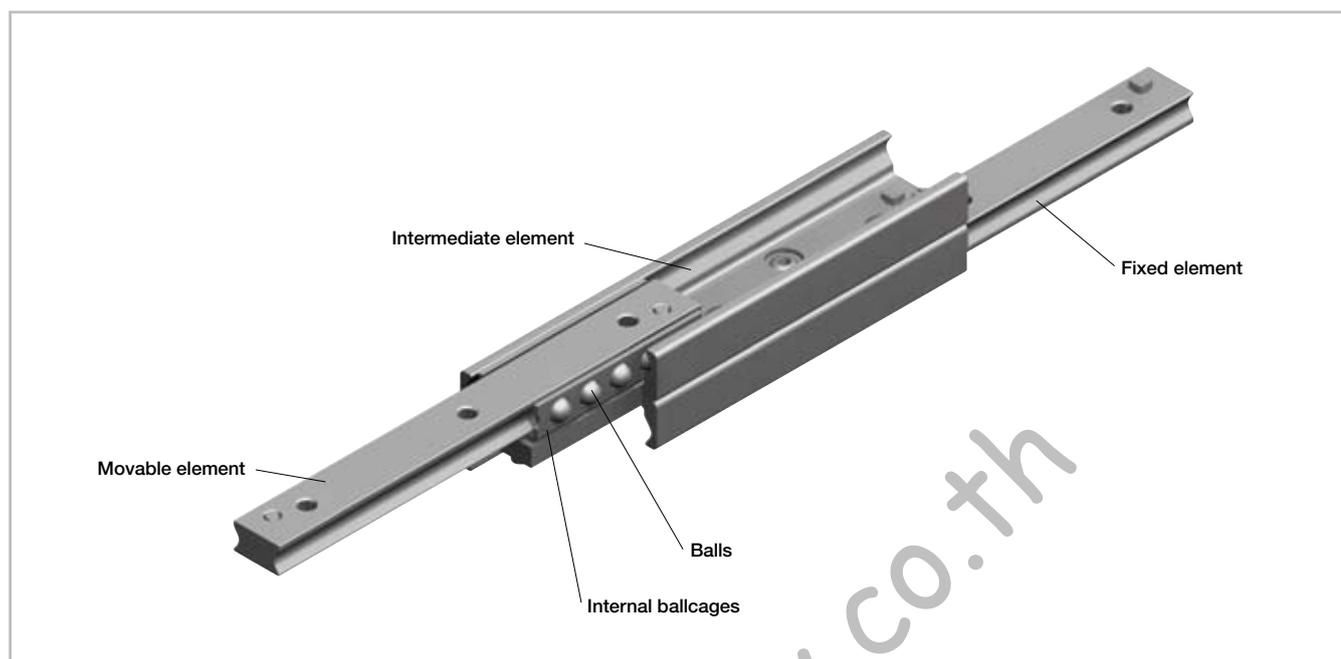

Fig. 9

## Performance characteristics:

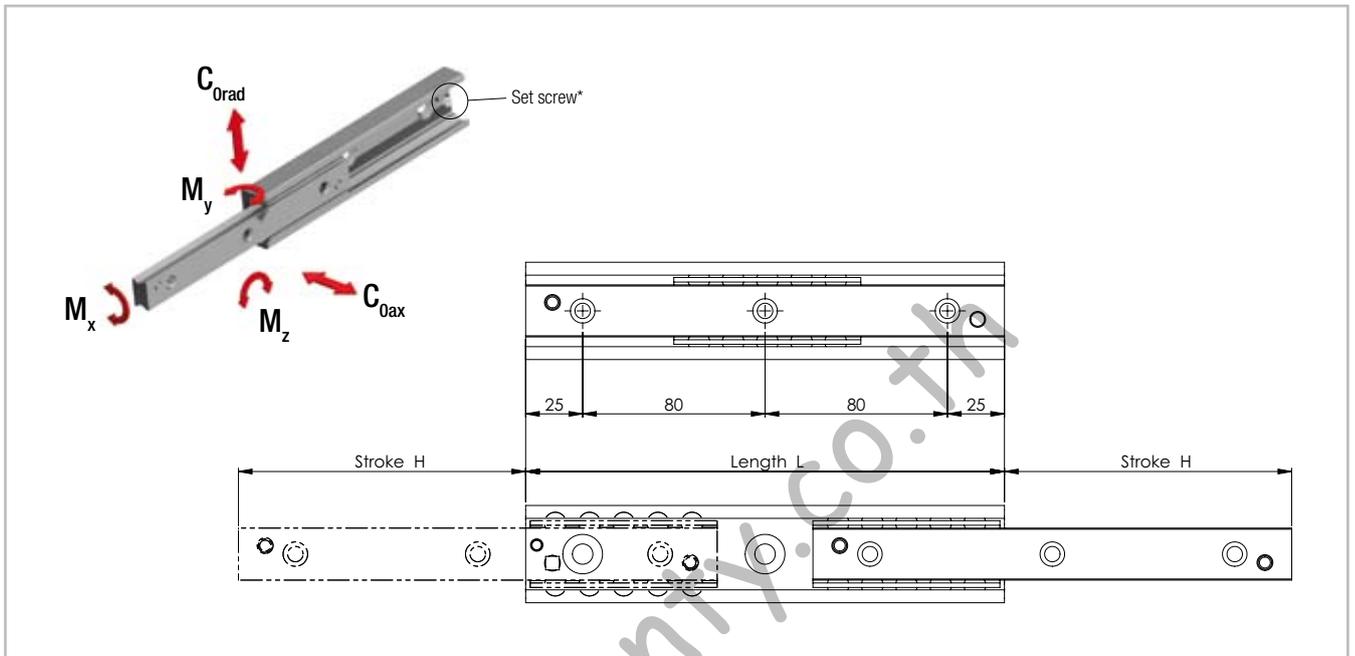

- Available sizes ASN / DE: 22, 28, 35, 43, 63
- Available sizes DS: 28, 35, 43, 63
- Available sizes DBN: 22, 28, 35, 43
- Available size LTF: 44
- Available size DMS: 63
- Available size DRT: 43
- Induction hardened raceways (except LTF)
- Rails and sliders made of cold-drawn roller bearing steel
- Balls made of hardened roller bearing steel
- Max. operating speed: 0.8 m/s (31.5 in/s)  
(depending on application)
- ASN, DE, DBN, LTF temperature range: -30 °C to +170 °C (-22 °F to +338 °F), DS, DRT: -30 °C to +110 °C (-22 °F to +230 °F)
- Electrolytic galvanised as per ISO 2081, increased anticorrosive protection on request (see pg. 36 Anticorrosive protection)

## Remarks:

- Horizontal installation is recommended
- Vertical installation on request
- External end stops are recommended
- Double-sided stroke in ASN, DSD, DE, DBN series (DMS on request)
- Custom strokes on request
- All load capacity data are based on one telescopic rail
- All load capacity data are based on continuous operation
- Calculation of the service life is based exclusively on the loaded rows of balls
- For models DSB, DMS and DRT, please observe right or left side use
- DRT 43 must be fixed with Torx® screws (custom design, included in delivery) ASN 63 and DMS 63 can be fixed with Torx® screws as an alternative
- Fixing screws of property class 10.9 must be used for all telescopic rails
- Internal stops are used to stop the unloaded slider and the ball cage. Please use external stops as end stops for a loaded system

## DS Version B

Version B with locking in extracted state (blocking system)

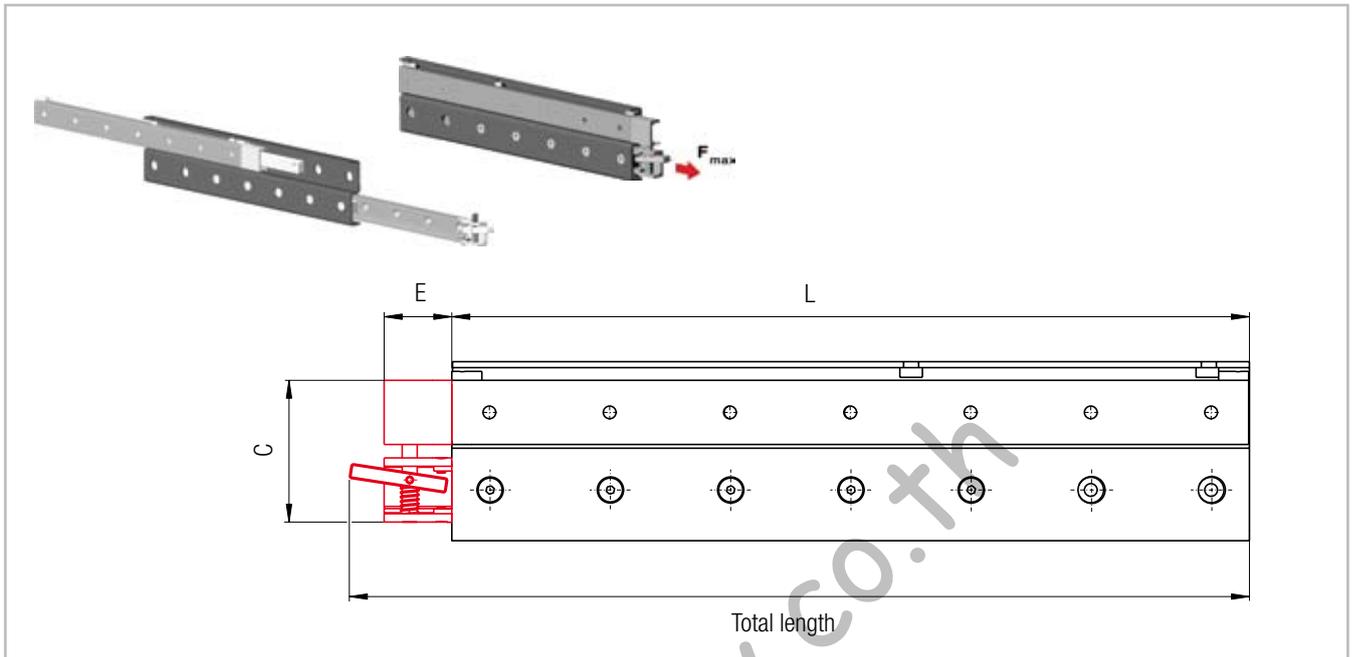

Fig. 14

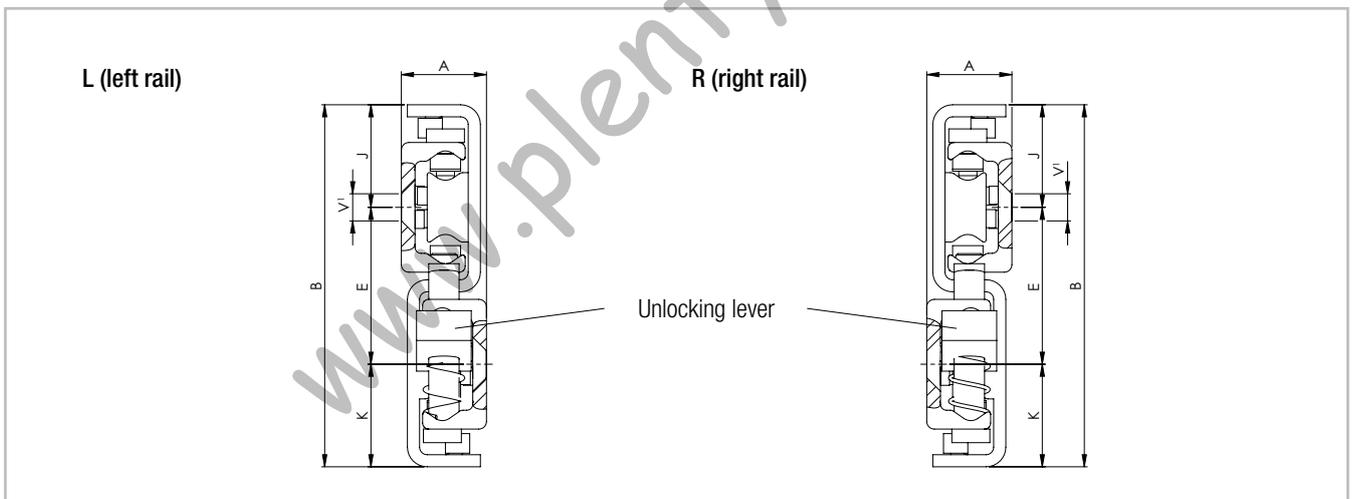

Fig. 15

<sup>1</sup> Fixing holes (V) for countersunk head screws according to DIN 7991

Version DSB is built on the design with one-sided extension (DSS). The same load capacities, cross-sections and available rail lengths apply (see pg. 12ff). Data in Table 10 are based on the special features of the locking mechanism.

Please observe right or left installation for version DSB. The maximum load on the locking in the extension direction is indicated by  $F_{max}$ .

| Type | Size | L [mm]            | Total length [mm] | C [mm] | E [mm] | $F_{max}$ [N] | Weight [kg/m] |
|------|------|-------------------|-------------------|--------|--------|---------------|---------------|
| DSB  | 28   | from 290 to 1490* | L + 52            | 63     | 35     | 2460          | 6.51          |
|      | 43   | from 530 to 1970* | L + 69            | 95     | 45     | 5630          | 14.98         |

\* for available lengths, see pg. 12, tab. 5 and 7 (DSS)

## DE Load capacities

\* Remove the set screw to reach all the fixing holes

Fig. 18

There are three versions of fixing holes available for the DE series in sizes 22 to 43:

Version DEF with threaded holes,

Version DEV with counter-sunk holes,

Version DEM, both variants (mixed) (see fig. 19).

Size 63 is only available with threaded holes.

## Custom Design DE Version D

### Version D with driving disc

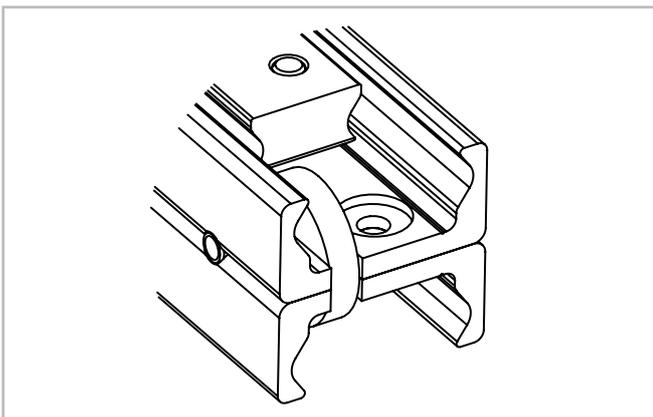

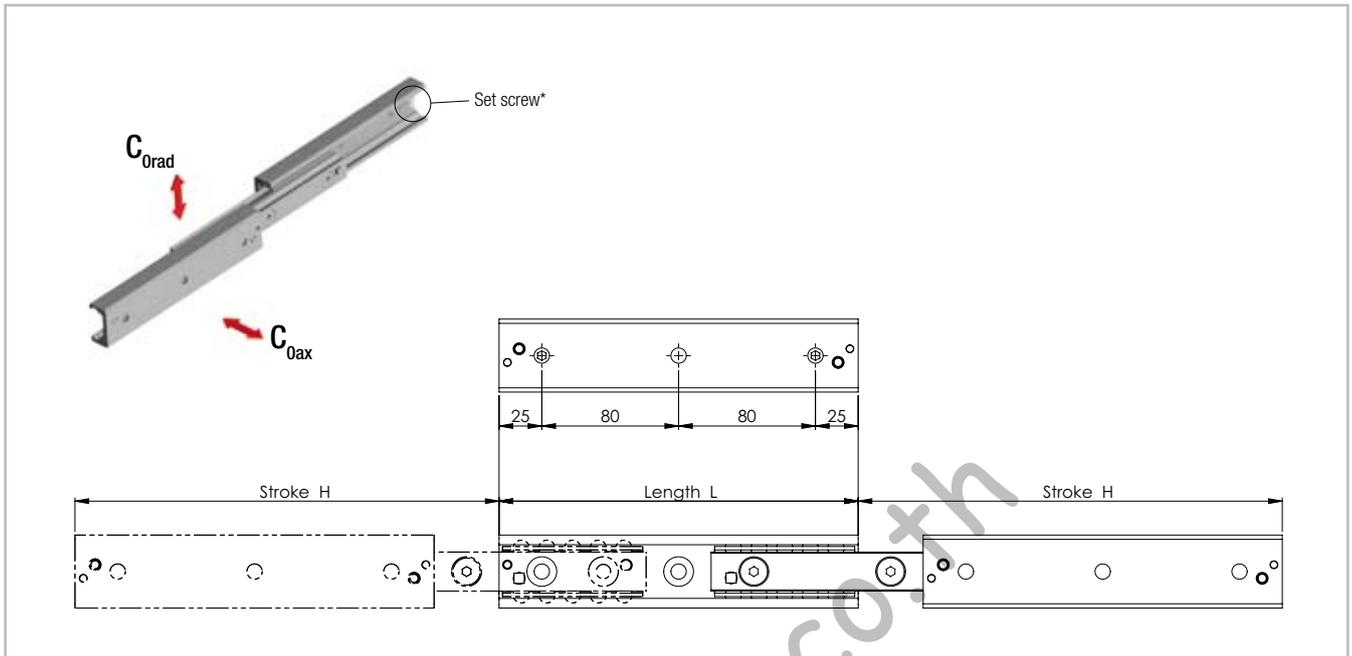

Fig. 20

The eccentrically located driving disc on both ends of the DE...D ensures that the intermediate element is carried along and does not remain standing at an undefined location during double-sided strokes. This custom design is available in sizes 22, 28, 35 and 43 with all three versions of the fixing holes. It is built on the standard design of the DE series, however deviates in the technical data based on the model. For more information please contact Application Technology.

## DBN Load capacities

\* Remove the set screw to reach all the fixing holes

# Technical instructions

## Selection of the telescopic rail

Selecting the suitable telescopic rail should be done based on the load and the maximum permissible deflexion in the extended state. The load capacity of a telescopic rail depends on two factors: the loading capacity of the ballcage and the rigidity of the intermediate element. For mainly short strokes the load capacity is determined by the load-bearing capacity of the ballcage; for average and long strokes it is determined by the rigidity of the intermediate element. Therefore series, which otherwise contain comparable components, are also suited for differing load capacities.

## Load capacities

The values in the load capacity tables of the corresponding series (see Sect. 3, Product Dimensions, pg. 8ff) give the maximum permissible loading of a telescopic rail in the centre of the movable rail in the completely extended state.

All load capacity data is based on a telescopic rail.

Typically, a pair of rails is used and the loading acts in the centre on both rails (see fig. 30,  $P_1$ ).

In this case, the load capacity of a rail pair is:

$$P_1 = 2 \cdot C_{\text{Orad}}$$

Fig. 29

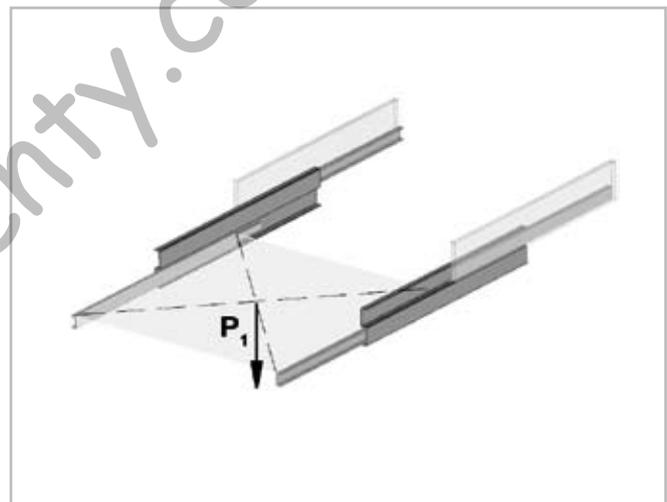

Fig. 30

## Deflexion

If the load  $P$  acts vertically on the rail (see fig. 33), the expected elastic deflexion of the individual telescopic rail in the extended state can be determined as follows:

$$f = \frac{q}{t} \cdot P \text{ (mm)}$$

Fig. 31

Whereby:

$f$  is the expected elastic deflexion in mm

$q$  is a stroke coefficient (see fig. 34)

$t$  is a factor depending on the model of the telescopic rail (see fig. 32)

$P$  is the actual load acting on the centre of a rail, in N

Also refer to page 31 for checking the static load

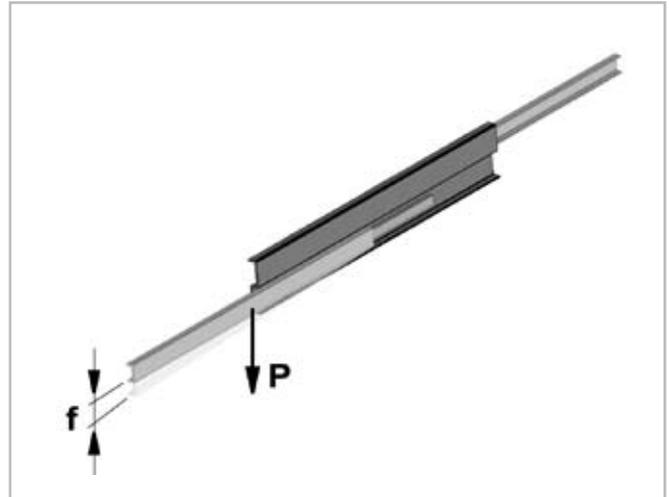

Fig. 33

| DE63 | $t = 540$  |       |            |

Fig. 32

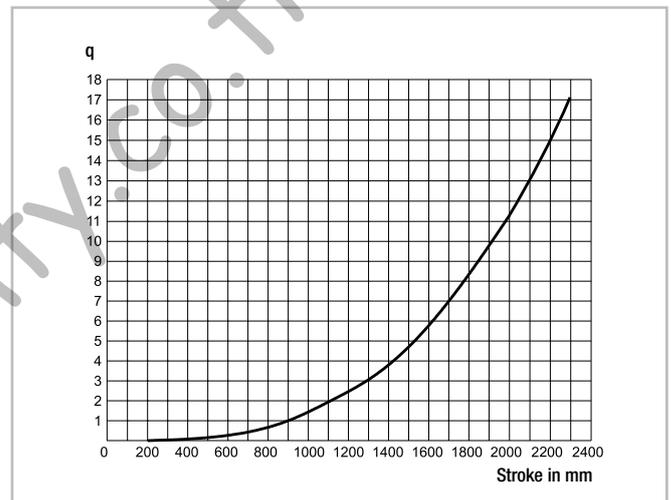

Fig. 34

Note: The above formula (see fig. 31) applies to a single rail. When using a rail pair, the load of the single rail is  $P = P_1/2$  (see pg. 29, fig. 30). This estimated value assumes an absolutely rigid adjacent construction. If this rigidity is not present, the actual deflexion will deviate from the calculation.

Important:

With the partial extensions of the ASN series, the deflexion is almost completely determined by the rigidity, i.e. by the moment of inertia of the adjacent construction.

## Static load

The telescopic extension of the various series accept different forces and moments (see Sect. 3, Product dimensions, pg. 8ff).

During the static tests the radial load capacity,  $C_{Orad}$ , the axial load capacity,  $C_{Oax}$ , and moments  $M_x$ ,  $M_y$  and  $M_z$  indicate the maximum permissible values of the loads; higher loads negatively effect the running properties

and the mechanical strength. A safety factor,  $S_0$ , is used to check the static load, which takes into account the basic parameters of the application and is defined in more detail in the following table:

### Safety factor $S_0$

|  |         |
|--|---------|
| Neither shocks nor vibrations, smooth and low-frequency reverse, high assembly accuracy, no elastic deformations | 1 - 1.5 |
| Normal installation conditions   | 1.5 - 2 |
| Shocks and vibrations, high-frequency reverse, significant elastic deformation                                   | 2 - 3.5 |

Tab. 31

The ratio of the actual load to maximum permissible load may be as large as the reciprocal of the accepted safety factor,  $S_0$ , at the most.

$$\frac{P_{Orad}}{C_{Orad}} \leq \frac{1}{S_0} \quad \frac{P_{Oax}}{C_{Oax}} \leq \frac{1}{S_0} \quad \frac{M_1}{M_x} \leq \frac{1}{S_0} \quad \frac{M_2}{M_y} \leq \frac{1}{S_0} \quad \frac{M_3}{M_z} \leq \frac{1}{S_0}$$

Fig. 35

The above formulas are valid for a single load case. If two or more of the described forces act simultaneously, the following check must be made:

$$\frac{P_{Orad}}{C_{Orad}} + \frac{P_{Oax}}{C_{Oax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} \leq \frac{1}{S_0}$$

$P_{Orad}$  = effective radial load  
 $C_{Orad}$  = permissible radial load  
 $P_{Oax}$  = effective axial load  
 $C_{Oax}$  = permissible axial load  
 $M_1$  = effective moment in the x-direction  
 $M_x$  = permissible moment in the x-direction  
 $M_2$  = effective moment in the y-direction  
 $M_y$  = permissible moment in the y-direction  
 $M_3$  = effective moment in the z-direction  
 $M_z$  = permissible moment in the z-direction

Fig. 36

## Service life

The service life is defined as the time span between commissioning and the first fatigue or wear indications on the raceways. The service life of a telescopic rail is dependent on several factors, such as the effective load, the installation precision, occurring shocks and vibrations, the operating temperature, the ambient conditions and the lubrication. Calculation of the service life is based exclusively on the loaded rows of balls.

In practice, the decommissioning of the bearing, due to its destruction or extreme wear of a component, represents the end of service life.

This is taken into account by an application coefficient ( $f_i$  in the formula below), so the service life consists of:

$$L_{km} = 100 \cdot \left( \frac{\delta}{W} \cdot \frac{1}{f_i} \right)^3$$

$L_{km}$  = calculated service life in km

$\delta$  = load capacity factor in N

$W$  = equivalent load in N

$f_i$  = application coefficient

Fig. 37

### Application coefficient $f_i$

|   | ASN, DS, DE, DBN, DRT | LTF       |
|---|-----------------------|-----------|
| Neither shocks nor vibrations, smooth and low-frequency direction change, clean environment | 1.3 - 1.8             | 2.3 - 2.8 |
| Light vibrations and average direction change   | 1.8 - 2.3             | 2.8 - 3.3 |
| Shocks and vibrations, high-frequency direction change, very dirty environment              | 2.3 - 3.5             | 3.3 - 4.5 |

Tab. 32

If the external load,  $P$ , is the same as the dynamic load capacity,  $C_{Orad}$  (which of course must never be exceeded), the service life at ideal operating conditions ( $f_i = 1$ ) amounts to 100 km.

Naturally, for a single load  $P$ , the following applies:  $W = P$ . If several external loads occur simultaneously, the equivalent load is calculated as follows:

$$W = P_{rad} + \left( \frac{P_{ax}}{C_{Oax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} \right) \cdot C_{Orad}$$

Tab. 37

## Speed

The maximum operating speed is determined by the mass of the intermediate element, which moves with the movable rail. This reduces the maximum permissible operating speed with increasing length (see fig. 39).

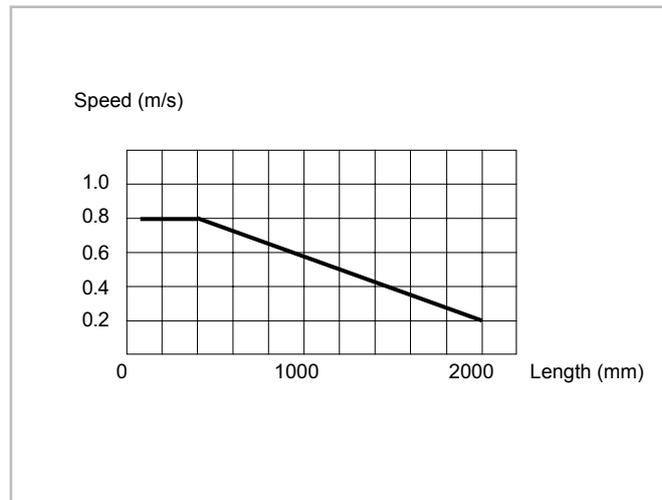

Fig. 39

## Extension and extraction force

The required actuation forces of a telescopic rail depend on the acting load and the deflexion in the extended state. The force required for opening is principally determined by the coefficient of friction of the linear bearing. With correct assembly and lubrication, this is 0.01. During the extension, the force is reduced with the elastic deflexion of the loaded

telescopic rail. A higher force is required to close a telescopic extension, since, based on the elastic deflexion, even if it is minimal, the movable rail must move against an inclined plane.

## Double-sided stroke

For all designs allowing double-sided stroke, it must be observed that the position of the intermediate element is defined only in the extended state. In the extracted state, the intermediate element can protrude by half of its length on each side. Exception is the ASN series, which comes out as a partial extension without an intermediate element and the custom design of series DE with driving disc.

The double-sided stroke in series ASN, DE und DBN is achieved by removing the set screw. For series DS version D, the double-sided stroke is implemented by design adaptation. Double-sided stroke for series DMS on request. Series DS version B, DRT and LTF are not available with double-sided stroke.

## Temperature

- Series ASN, DE, DBN and LTF can be used up to an ambient temperature of +170 °C (+338 °F). A lithium lubricant for high operating temperatures is recommended for temperatures above +130 °C (+266 °F).
- Series DS and DRT have a useable range of -30 °C to +110 °C (-22 °F to +230 °F) because of the rubber stop.

### Anticorrosive protection

- All of the Telescopic Rail product series have a standard anticorrosive protection by electrolytic galvanisation according to ISO 2081. If increased anticorrosive protection is required, the rails are available chemically nickel plated and with corrosion resistant steel balls.
- Numerous application-specific surface treatments are available upon request, e.g., as a nickel-plated design with FDA approval for use in the food industry.  
For more information please contact Application Technology.

### Lubrication

- Recommended lubrication intervals are heavily dependent upon the ambient conditions, speed and temperature. Under normal conditions, lubrication is recommended after 100 km operational performance or after an operating period of six months. In critical application cases the interval should be shorter. Please clean the raceways carefully before lubrication. Raceways and spaces of the ball cage are lubricated with a lithium lubricant of average consistency (roller bearing lubricant).
- Different lubricants for special applications are available upon request.  
Example: Lubricant with FDA approval for use in the food industry.  
For more information please contact Application Technology.

## Fixing screws

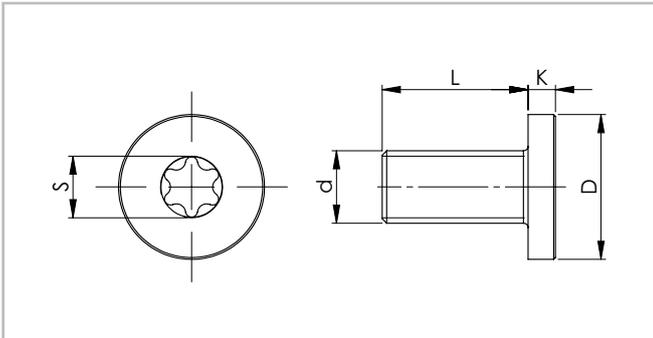

Fig. 40

The DRT 43 roller telescopic must be fixed with a custom design of Torx® screws with low cap head. The screws are included in the scope of supply. All other rails are fixed with counter-sunk or cap head screws as per DIN 7991 or 7984. In size 63 of the ASN and DMS series, Torx® screws with low head cap screws are available on request (see fig. 40).

| Size | Screw type | d         | D [mm] | L [mm] | K [mm] | S   |
|------|------------|-----------|--------|--------|--------|-----|
| 63   | M8 x 20    | M8 x 1.25 | 13     | 20     | 5      | T40 |
| 43   | M8 x 16    | M8 x 1.25 | 16     | 16     | 3      |     |

### Tightening torques of the standard fixing screws to be used

| Property class | Size | Tightening torque [Nm] |
|----------------|------|------------------------|
| 10.9           | 22   | 4.3                    |
|                | 28   | 8.5                    |
|                | 35   | 14.6                   |
|                | 43   | 34.7                   |
|                | 63   | 34.7                   |

Tab. 39

## Installation instructions

\* For models DSB, DMS and DRT, please observe right or left side use

Fig. 41

### General

- Internal stops are used to stop the unloaded slider and the ball cage. Please use external stops as end stops for a loaded system.
- To achieve optimum running properties, high service life and rigidity, it is necessary to fix the telescopic rails with all accessible holes on a rigid and level surface. When using two telescopic rails, please observe the parallelism of the installation surfaces. The fixed and movable rails fit to the rigid assembly construction.
- Telescopic Rail guides are suitable for continuous use in automatic systems. For this, the stroke should remain constant in all moving cycles and the operating speed must be checked (see pg. 35, fig. 39).  
The movement of the telescopic rails is enabled by internal ballcages, which could experience an offset from the original position with differing strokes. This phase offset can have a negative effect on the running properties or limit the stroke. If differing strokes occur in an application, the drive force must be sufficiently dimensioned in order to appropriately synchronise the ballcage offset. Otherwise, an additional maximum stroke must be planned regularly to ensure the correct position of the ballcage.

### ASN

- Series ASN accepts radial and axial loads and moments in all principle directions.
- Horizontal and vertical application is possible. Prior to vertical installation, we recommend a check by application technology.
- The installation of two partial extensions on a profile provides a load capable full extension. For individual solutions, please contact Application Technology.

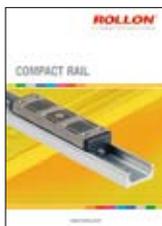

### DE / DBN

- Series DE and DBN accept radial and axial loads.
- Horizontal and vertical application is possible. Prior to vertical installation, we recommend a check by application technology.
- The functionality of custom design DE...D is only guaranteed if the stroke available is completely used.

### DS / LTF / DMS / DRT

- Series DS, LTF, DMS and DRT accept radial loads. This should act in the vertical cross-sectional axis on the movable rails.
- Horizontal and vertical application is possible. Prior to vertical installation, we recommend a check by application technology.
- When installing make sure that the load is placed on the movable element (the lower rail) (see fig. 41).  
The opposite assembly negatively affects the function.
- Installation must be done on a rigid adjacent construction using all accessible fixing holes.
- Pay attention to the parallel alignment during assembly with paired application.

# Portfolio

## COMPACT RAIL

Rugged roller sliders with innovative self adjustment

## MONO RAIL

Profile guideways for highest degrees of precision

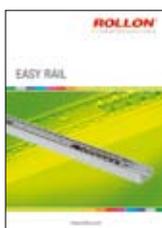

## CURVILINE

Curvilinear rails for constant and variable radii

## MINIATURE MONO RAIL

Miniature format profile guideways with unique ball design

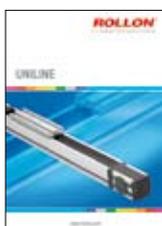

## EASY RAIL

Compact, versatile linear bearings

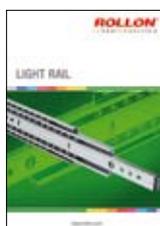

## X-RAIL

Roller embossed stainless steel profiles for the use in rough environments

## UNILINE

Steel-reinforced, belt-driven linear actuators with hardened steel linear bearings and precision radial ball bearing rollers

## LIGHT RAIL

Full and partial extension, lightweight drawer slides

Ordering example 1: ASN35-0770

Ordering example 2: DSB28-0690-0885-L-NIC

Notes on ordering: Information for right and left side installation and for expanded surface protection is only necessary if required.

Rail lengths and strokes are always stated with 4 digits. Please use zeroes to fill in for lengths with less than 4 digits

## Special strokes

Special strokes are defined as deviations from standard stroke H. They are each available as multiples of the values in tab. 40 and 41.

These values are dependent on the spacing of the ballage.

| Type       | Size | Stroke modification [mm] |
|------------|------|--------------------------|
| <b>ASN</b> | 22   | 7.5                      |
|            | 28   | 9.5                      |
|            | 35   | 12                       |

Tab. 41

Stroke modification of series DMS on request.

No stroke modification is possible for series DSD and DRT. Each stroke modification influences the load capacities stated in the catalogue. It can happen that after a stroke modification important fastening holes are no longer accessible. For more information please contact Application Technology.

# Fold out ordering key

To make this product catalog as simple as possible for you to use, we have included the following easy-to-read chart.

Your advantages:

- Description and ordering designations easy to read at one glance
- Simplified selection of the correct product
- Links to detailed descriptions in the catalog
